

Drainage holes

Drainage holes in roof deck profiles

Extra service

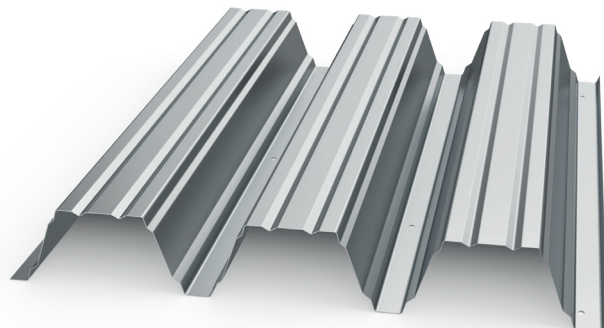

During the installation of the warm roof sheets, it may happen that water remains in the fluting of the profiled sheets after a rain shower. Besides being a labour-intensive job to remove the rainwater, it also poses a high risk of permanent damage to the sheets.

Thanks to an innovative production process, we can now provide our roofing sheets with drainage holes during production. This makes drilling holes during construction a thing of the past!

Ask our sales department about this extra service.

Advantages

- Quick installation
- No extra labour to remove water left on the roof
- No moisture damage from water left behind
- Same mechanical performance as profiles without holes
- Solexcel coating available to increase corrosion resistance of hole edges
